

BikeMaster's TruGel Nano Technology

BikeMaster's new TruGel battery uses a unique gel electrolyte that provides higher cranking amps, lasts twice as long as conventional batteries, resists vibration, is non-spillable even if the battery is cracked, and operates in any position. The BikeMaster TruGel battery also comes with a 2 year warranty.

1. Tough case with SuperSeal technology, locks in acid.
2. Unique Anti-Vibration Welding Technology also gives more cranking amps when you need them.
3. Special plate design increases surface area, gives superior cranking power, quicker charging and greater vibration resistance. Super High Density Oxide plates mean more "power per pound!"
4. NanoGel Electrolyte keeps this battery working when others will not! Incredible surface contact of the Nano particles means more power in hot and cold weather and no sulphation.
5. By combining all the advantages of Absorbed Glass Mat (AGM) Separators with the Nano-Gel technology, the result is that TruGel batteries are maintenance free, high power, no sulphation, with anti-vibration. It's the absolute top-of-the-line battery.
6. ABS Container: For strength, durability and reliability, protects the internal components from shock and heat giving the battery a longer life.
7. Special Terminal Seals: The unique design prevents acid seepage, corrosion and at the same time improves conductivity and extends battery life.
8. Safety Valves prevent dangerous pressure build up. They release any excess gas automatically. And because they are one way valves, no moisture can enter to reduce the battery's life.
9. Top Cap design makes this a true maintenance free battery, completely eliminating leakage and acid spills. Safer on the shelf, safer in your bike.
